genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase, and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a Cat-Mu transposon modified end

The transposan is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase; and recovering a transposon end acid having the transposon incorporated in the protein coding nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a modified Cat-Mu(Stop)-transposon
                                                                                                                                                                                                                                                                                                                                                                                                                                                  New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized by transposase useful for producing deletion derivatives of polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```

genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end acid having the transposon incorporated in the protein coding nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a modified Cat-Mu(Stop)-transposon

Sequence 1254 BP; 356 A; 296 C; 264 G; 338 T; 0 U; 0 Other;

The invention relates to a transposon nucleic acid comprising a

Claim 6; Page 30; Opp; English.

```
The present invention relates to a method for making an insertional mutation at a random or quasi-random position in cellular nucleic acid in a target cell comprising introducing into the target cell a synaptic complex. The method is particularly useful for efficiently inserting a transposable polynucleotide at random or quasi-random locations in the chromosomal or extra-chromosomal nucleic acid of a target cell. The method may also be used for screening the genome of cells that comprise an insertional mutation that induces a phenotypic or genotypic change relative to the cells that are not subject to insertional mutagenesis. The present sequence is the precut transposon end of Bacteriophage Mu non-transferred strand, used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1. .4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a transposon nucleic acid comprising a genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence in containing a transposase; and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a Cat-Mu transposon modified end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   by a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized transposase useful for producing deletion derivatives of polypeptide.

                                                                                                                                                                                                                                                            genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid at containing a polypeptide coding nucleic acid and in the presence of a transposon concaining a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase; and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a Cat-Mu transposon containing wild

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to methods of preparing a targeting construct for use in a targeting vector capable of modifying a target DNA sequence, by obtaining a copy of the target DNA sequence in vitro, innerting a DNA sequence comprising a transposon sequence and a DNA recombination sequence at two sites in the copy of the target DNA sequence, and inducing a recombination event between the recombination sequences to delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target construct for use in a targeting vector for gene targeting or homologous recombination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer used in an example of the invention

The invention relates to methods of preparing a targeting construct for use in a targeting vector capable of modifying a target DNA sequence, by obtaining a copy of the target DNA sequence in vitro, innerting a DNA sequence and user, into, innerting a DNA sequence and a DNA recombination sequence comprising a transposon sequence and a DNA recombination sequence, and inducing a recombination event between the recombination sequence, and delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target recompositions of the present invention are useful for preparing a target recompination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer used in an example of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preparing a targeting construct using a transposon and DNA recombination sequence, useful in making a targeting vector capable of modifying plant and/or animal genome in a predetermined way.
                                                                             Transposon-based targeting construct related primer Mu2-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 5; Page 50; 92pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to methods of preparing a targeting construct for obtaining a copy of the target DNA sequence in vitro, inserting a DNA sequence, by obtaining a copy of the target DNA sequence in vitro, inserting a DNA sequence comprising a transposon sequence and a DNA recombination sequence at two sites in the copy of the target DNA sequence, and inducing a recombination event between the recombination sequences to delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target construct for use in a targeting vector for gene targeting or homologous recombination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer used in an example of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Preparing a targeting construct using a transposon and DNA recombination sequence, useful in making a targeting vector capable of modifying plant and/or animal genome in a predetermined way.

The invention relates to a transposon nucleic acid comprising a genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase, and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a modified Cat-Mu transposon containing Mu ends with engineered NotI restriction site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting a mismatch in a test double stranded nucleic acid target, useful for typing a pathogenic microorganism strain, comprises detecting transposition of the Mu-end nucleic acid into the target.
                                                                                      New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized by transposase useful for producing deletion derivatives of polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of detecting a mismatch in a test double stranded nucleic acid target which comprises detecting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequence comprising a transport on a sequence and a DNA recombination sequence of transports on the copy of the target DNA sequence, and inducing a recombination event between the recombination sequences to delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target construct for use in a targeting vector for gene targeting or homologous recombination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer used in an example of the invention
                                                                                                                                                                                                                                                                    Preparing a targeting construct using a transposon and DNA recombination sequence, useful in making a targeting vector capable of modifying plant and/or animal genome in a predetermined way.
                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to methods of preparing a targeting construct for use in a targeting vector capable of modifying a target DNA sequence, by obtaining a copy of the target DNA sequence in vitro, inserting a DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         *tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of detecting a mismatch in a test double stranded nucleic acid target which comprises detecting transposition of the Mu-end nucleic acid into the target, where transposition at the predominant site indicates the presence of mismatch at about that site. The methods are useful for typing a pathogenic microorganism strain, for screening an embryo for the presence of mutation, for detecting the presence of known mutation in a gene of interest, detecting the presence of a previously unidentified mutation in a gene of interest, and diagnosing the presence or absence of a tumourantation. The kit is useful for detecting the presence of a mutation or polymorphism of interest in a nucleic acid molecule. The present sequence represents the Mu end DNA fragment construction

The methods are useful for typing a pathogenic microorganism strain, for screening an embryo for the presence of mutation, for detecting the presence of known mutation in a gene of interest, detecting the presence of a previously unidentified mutation in a gene of interest, and diagnosing the presence or absence of a tumourpromoting mutation. The kit is useful for detecting the presence of a mutation or polymorphism of interest in a nucleic acid molecule. The present sequence represents the Mu end DNA fragment construction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting a mismatch in a test double stranded nucleic acid target, useful for typing a pathogenic microorganism strain, comprises detecting transposition of the Mu-end nucleic acid into the target.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a Mu-like transposable element (1) used for generating functional fusion proteins after insertion into a target DNA. The Mu-like element comprises: (a) a left transposable element attachment site atts and a right transposable element attachment site attR. where attR is no more than 62 nucleotides long; (b) a site for insertion of an exogenous DNA sequence encoding for a protein domain located between attL and attR; (c) after insertion of the transposable element into a target DNA sequence, a fusion mRNA sequence is transcribed originating either from the target DNA on either side of the transposable element or from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Generating fusion proteins using transposable elements, useful for development of a protein domain library and in the construction of multi-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               inside the transposable element and continuing through the attachment site sequences and into the protein coding region, resulting in a single fusion open reading frame (OFF). The constructs are useful in the development of a protein domain library, in the construction of multi-
                                                                                                                                                                                                                                                                                                                                       Transposon Mu; transposable element; fusion protein; attachment site; attL; attR; protein domain library; enzyme; accelerated evolution; 88

//note="Vector: pBluescript SK(-); Site_1: ECORI; Site_2: Xhof; Morex (mla) plants were greenhouse grown in the R Wise lab at Iowa State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria graminis f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-inoculation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified con Albarary was made, and I million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (COGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wingy Yu, Frisch, Henry, Simmons, Ostes, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or enemance analysis or preparation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1;

//note="Vector: pBlueeript SK(-); Site_1: ECORI; Site_2: XhoI; Morex (mla) plants were greenhouse grown in the R wise lab at lowa State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria graminis f: sp. hordei, and leaves were harvested 24, 48 and 72 hr post-inoculation and snap frozen (Wise). In the TV Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and I million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson

green seedlings were infected with isolate 5874 of Blumeria graminis f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-incoulation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give phluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Prisch, Aktins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see thtp://www.genome.clemson.edu/projects/barley. /note="Vector: pBluescript SK(-) Site_1: ECORI; Site_2: XhOI; Morex (mla) plants were greenhouse grown in the R Wise lab at lowa State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria grammins f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-incoulation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture one primary unamplified CDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Palmer, Arkins and Wing). Plasmid DNA preparations. DNA
